

3D Scanning Applications for Manufacturing

written by Lauri Moon | June 16, 2021

3D scanners are useful tools for many applications, including reverse engineering, fit verification, product development, and quality inspections.

In this webinar, you will learn the 3D scanning process from start to finish, how scanners differ depending on the task at hand, witness the actual use of a handheld structured light scanner, applications for the scanned data once it has been collected, and how reverse engineering solid CAD files differ from producing scan data alone.
