

Developing an Energy Baseline for Complex Facilities

written by Lauri Moon | February 23, 2017

This webinar will review the steps for developing and analyzing the energy baseline at industrial facilities and large commercial buildings. We will review how to identify major energy use inputs, the tools required for the project, and how to accurately account for variables. A well-developed energy baseline will allow for the identification of suitable energy efficiency projects and the incorporation of corporate energy footprint into longer-term decision making.
