

Industry Standards for Producing Respirators, Masks and Related Safety Equipment

written by Lauri Moon | September 25, 2020

The current pandemic is dramatically increasing demand for verifiably tested medical and safety products, resulting in empty inventories and strained supply chains. During this webinar, Nelson Labs and SGS will share how the quality and integrity of medical and safety equipment is determined by a robust system of domestic and global standards.

Nelson Labs is a global provider of laboratory testing and advisory services for medical technology and pharmaceutical companies. SGS is an inspection, verification, testing and certification company. Speakers from these two companies will provide insights on how to prevent risks and ensure these products can truly meet the required safety standards. After the presentation, the guest speakers will answer audience questions.

This webinar will be shared via the BlueJeans webinar platform.
